Ultrasound Guided Axillary Nerve Block

Emergency physician performed ultrasound-guided regional anesthesia is an evolving field that offers many potential benefits in the emergency setting: Analgesia can be targeted specifically to the region of pain and provide relief for many hours, large volumes of local anesthetic can be avoided and there is also less need for general sedation without the increased morbidity to patients.

The Fascia Iliaca Compartment Block. At Last, a simple and reliable nerve block to offer for post-operative pain relief for patients with total hip arthroplasties, endoprosthesis, and femoral nails, The Fascia Iliaca Compartment Block. It's not a new technique, it's just simpler using ultrasound guidance. The fascia iliaca block targets the same nerves as the lumbar plexus but uses an ...

Brachial plexus block is a regional anesthesia technique that is sometimes employed as an alternative or as an adjunct to general anesthesia for surgery of the upper extremity. This technique involves the injection of local anesthetic agents in close proximity to the brachial plexus, temporarily blocking the sensation and ability to move the upper extremity.

In the last 10 years, ultrasonography has become an extremely effective examination for exploring the nerves of the upper limb. The brachial plexus is still one of the few areas dreaded by musculoskeletal ultrasonographers because of its complex anatomy and its bony relations (the clavicle) hindering exploration.

Given the many benefits of PNBs in practice, it is not surprising that their use has expanded over the last several decades. PNBs are now a common component of analgesia for both upper extremity (eg, brachial plexus block using interscalene, supra- or infraclavicular, and axillary nerve approaches) and lower extremity (eg, lumbar plexus, femoral, sciatic, and popliteal sciatic blocks, among ...
